

- ? QuickSort: average time complexity $O(n \log n)$, worst case $O(n^2)$.
- ? MergeSort: stable, always $O(n \log n)$, uses extra memory.
- ? BubbleSort: $O(n^2)$, mainly used for teaching.

Choosing a sort

- ? Use MergeSort when stability matters.
- ? Use QuickSort for in-place average-case speed.
- ? Avoid BubbleSort in production.
